Question 2
Correct
Marked out of 5.00

F Flag question

Numeros the Artist had two lists that were permutations of one another. He was very proud. Unfortunately, while transporting them from one exhibition to another, some numbers were lost out of the first list. Can you find the missing numbers?

As an example, the array with some numbers missing, arr = [7, 2, 5, 3, 5, 3]. The original array of numbers brr = [7, 2, 5, 4, 6, 3, 5, 3]. The numbers missing are [4, 6].

## Notes

- · If a number occurs multiple times in the lists, you must ensure that the frequency of that number in both lists is the same. If that is not the case, then it is also a missing number.
- · You have to print all the missing numbers in ascending order.
- · Print each missing number once, even if it is missing multiple times.
- The difference between maximum and minimum number in the second list is less than or equal to 100.

Complete the code in the editor below. It should return an array of missing numbers.

It has the following:

- arr: the array with missing numbers
- · brr: the original array of numbers

# Input Format

There will be four lines of input:

n - the size of the first list, arr

The next line contains n space-separated integers arr[i]

m - the size of the second list, brr

The next line contains  ${\it m}$  space-separated integers  ${\it brr[i]}$ 

## Constraints

- $1 \le n, m \le 2 \times 10^5$
- n ≤ m
- $1 \le brr[i] \le 2 \times 10^4$
- $X_{max} X_{min} < 101$

# **Output Format**

Output the missing numbers in ascending order.

# Sample Input

10

203 204 205 206 207 208 203 204 205 206

203 204 204 205 206 207 205 208 203 206 205 206 204

# Sample Output

204 205 206

# Explanation

204 is present in both arrays. Its frequency in arr is 2, while its frequency in brr is 3. Similarly, 205 and 206 occur twice in arr, but three times in brr. The rest of the numbers have the same frequencies in both lists.

Answer: (penalty regime: 0 %)

```
Answer: (penalty regime: 0 %)
   1 #include <stdio.h>
    2 v int main(){
            int n,m,c,cl=0,co;
scanf("%d",&n);
    3
    4
    5
             int arr[n];
             for(int a=0;a<n;a++){
    scanf("%d",&arr[a]);</pre>
    6
    7
    8
             scanf("%d",&m);
   9
             int brr[m],ans[m];
  10
             for (int b=0;b<m;b++){
    scanf("%d",&brr[b]);</pre>
  11
  12
  13
  14
             for(int j=0;j<m;j++){</pre>
  15
                  c=0;
                  for(int i=0;i<n;i++){</pre>
  16 -
                       if(arr[i]==brr[j]){
  17
  18
                           c=1;
  19
                            arr[i]=<mark>-1</mark>;
  20
                            break;
  21
  22
                  if (c==0){
  23
  24
                       ans[cl]=brr[j];
  25
                       cl++;
  26
  27
             for (int a=0;a<cl;a++){
  28 +
```

```
32
                     co++;
33
34
35
             int temp=ans[a];
36
             ans[a]=ans[co];
37
             ans[co]=temp;
38
39
        for (int i=0;i<cl;i++)</pre>
40
           printf("%d ",ans[i]);
41
        return 0;
42 }
```

Question 3
Correct
Marked out of 5.00
F Flag question

Watson gives Sherlock an array of integers. His challenge is to find an element of the array such that the sum of all elements to the left is equal to the sum of all elements to the right. For instance, given the array  $arr = \{5, 6, 8, 11\}$ ,  $array = \{5, 6, 8, 11\}$ ,  $array = \{5, 6, 8, 11\}$ ,  $array = \{6, 6, 8, 11\}$ , ar

You will be given arrays of integers and must determine whether there is an element that meets the criterion.

Complete the code in the editor below. It should return a string, either YES if there is an element meeting the criterion or NO otherwise.

It has the following:

· arr: an array of integers

## Input Format

The first line contains T, the number of test cases.

The next  ${\it T}$  pairs of lines each represent a test case.

- The first line contains **n**, the number of elements in the array **arr**.
- The second line contains n space-separated integers arr[i] where  $0 \le i < n$ .

#### Constraints

- . 1 ≤ T ≤ 10
- $1 \le n \le 10^5$
- $1 \leq arr[i] \leq 2 \times 10^4$
- . 0 ≤ i ≤ n

## **Output Format**

For each test case print YES if there exists an element in the array, such that the sum of the elements on its left is equal to the sum of the elements on its right; otherwise print NO.

#### Sample Input 0

2

3

123 4

1233

# Sample Output 0

NO

YES

# Explanation (

For the first test case, no such index exists.

For the second test case, arr[0] + arr[1] = arr[3], therefore index 2 satisfies the given conditions.

# Sample Input 1

3

5

11411

4

2000

0020

# Sample Output 1

YES

YES

# Explanation 1

In the first test case, arr[2] = 4 is between two subarrays summing to 2.

In the second case, arr[0] = 2 is between two subarrays summing to 0.

```
Answer: (penalty regime: 0 %)
    1 #include <stdio.h>
        void check(int n,int arr[]){
   int total_sum=0,left_sum=0;
    2 +
    3
    4 +
             for (int i=0;i< n;i++){
                  total_sum+=arr[i];
    5
    6
             for(int i=0;i<n;i++){
   if(left_sum==total_sum-left_sum-arr[i]){
     printf("YES\n");</pre>
    7 .
    8 ,
    9
                       return
   10
   11
                  left_sum+=arr[i];
   12
  13
             printf("NO\n");
  14
  15
  16 -
        int main(){
             int T;
scanf("%d",&T);
